2019	Title 2011 Spring Breeding Indices of Ruffed Grouse	5/6/2011

Abstract: No drumming ruffed grouse males were heard on the 10 roadside survey routes (15 stops/route) during the 2011 survey period. The 5-year (2007-2011) mean drumming index for the control routes was 0.02 drummers per stop (~1 drummer heard every 50 stops) which is <2% of levels recorded during the peak years of 1979-81. For the sixth consecutive year, no drumming activity centers were located on the Maumee Grouse Study Area where population monitoring began in the early 1960's. Prospects for population recovery are poor to dismal given the continual advancement of forest succession. Ruffed grouse population levels are projected to drop below "viable population levels" within the next few years in portions of their existing range in south-central Indiana unless some intervention (e.g., extensive timber harvests of sufficient intensity) or sizable natural disturbances occur across the forested landscape to create early successional forest habitats.

Project/Activity: 300FWIW36R01000 W36R508

Ruffed grouse (*Bonasa umbellus monticola*.) breeding population indices (Drumming Index "DI" = mean number of males heard drumming/stop) were surveyed during the spring of 2011 (March 28 – April 22) along 10 roadside drumming trend routes (15 stops/route) in southern Indiana. Routes are conducted at least twice, in opposite directions, and the highest count used for determining the drumming index. The annual drumming male activity center count was conducted at the Maumee Grouse Study Area located on Hoosier National Forest in Jackson/Brown counties. For the second time (2 consecutive years) since the roadside counts were initiated in 1953, no male ruffed grouse were heard along the roadside drumming routes (**Table 1**). Drumming indices for the control routes have declined steadily the last 30 years since the peak of 1979-81 when the mean drumming index was 1.16, or roughly 17 male drummers heard per 15-stop route. The combined 5-yr mean DI (2007-2011) for the 8 annual control routes was 0.02 grouse heard per stop or 1 male grouse heard every 50 stops and is <2% than the 1979-81 peak.

Ruffed grouse population monitoring began on the Maumee Grouse Study Area in the early 1960's. For the 6th consecutive year, no drumming activity centers were located on the Maumee Grouse Study Area (**Table 2**). In 1980, 24 activity centers were identified and the estimated density was 5.8 grouse/100acres. Habitat on the Grouse Study Area is fairly reflective of habitat conditions on the Pleasant Run Unit of Hoosier National Forest.

Roadside drumming indices and Maumee density estimates show parallel downward trends over 30 years (**Figure 1**). Ruffed grouse population levels are projected to drop below "viable population levels" within the next few years in portions of their existing range in south-central Indiana unless some intervention (e.g. timber harvests of sufficient intensity) or sizable natural disturbances occur across the forested landscape to create early successional forest habitats. A reassessment of the ruffed grouse distribution and relative conservation status was conducted in 2008 (Backs and Castrale 2010). Since 1983, ruffed grouse appear to be extirpated from 15 counties and this extirpation trend is likely to exceed 25 counties within a few years if no major forest disturbance occurs. The plight of ruffed grouse reflects the declining early successional habitat base that is negatively impacting a wide array of wildlife species (Backs 2009, Dessecker 2011).

* = Indices calculated using route with highest count.

HICKORY = Hickory Ridge (USFS), Lawrence and Jackson Counties

OWPUT = General area of Owen-Putnam St. Forest

PERRY = northern portion of Perry Co.(USFS)

WASH = general area of Jackson-Washington St. Forest in Washington County

LR-EAST = Lost River Unit - East, USFS, Lawrence and Orange Counties.

MORGMON = general area of Morgan-Monore St. Forest in Morgan county.

GREENE = eastern Greene County

LICKCR = Lick Creek Area, USFS, in Orange County.

MEAN = Arithmetic average value for all routes

* Area covered varied from 800 to 1,000 acres; mean area covered = 875 acres.

** Assumes a 50:50 sex ratio and represents a minimum because of non-drumming males (Gullion 1981)
